

**SMP *Melaleuca pustulata* scrub**

**Community Description:**

*Melaleuca pustulata* scrub is a tall to medium dense shrubby vegetation dominated by *Melaleuca pustulata* naturally occurring along creeks and hill slopes on a range of soil types over dolerite. This community is confined to the central east coast from around Swansea to Cherry Tree Hill and inland to the lower slopes of the Eastern Tiers, where it can be locally common especially in areas previously cleared. Eucalypts and other trees may form a sparse emergent canopy. The ground layer often includes native grasses, sedges and shrubs less than a metre in height. This is the appropriate benchmark to use in assessing the condition of the listed *Melaleuca pustulata* scrub community (Schedule 3A, Nature Conservation Act 2002).
